### TEST COMMENTS:

*Cool and wet conditions during the spring delayed planting in the area. The rest of the season brought consistent showers with 8.4" in the last 3 weeks of September alone. This site received 27.2" from planting through October 1, 7.1" above the 30 year average. Plants were relatively short with very little lodging. Soil fertility was excellent, and a fungicide application was made to protect the crop during the wet season, but overall yield was a couple bushels below the 10 year average of IANO. Windy conditions removed about 1% grain moisture while harvesting the plot, explaining why grain moisture from the early season test was slightly higher than the full season test.*
