TEST COMMENTS:

We replanted the conventional hybrids on June 6th after we lost plots from a glyphosate application was applied accidentally. The replant was done manually with a push garden seeder. We repackaged seed and planted the correct seeds in each affected plot. The population and stand were not as uniform in the replanted plots. Most replants did mature and reduced sunlight variability in surrounding plots. The first 50 feet of plots were variable from possible sprayed drift or uneven fertilizer application as we noticed shorter corn and poor stalk health in that area. Strong yields for the majority of plots. The excess moisture last year helped the corn yields when the summer turned dry in the second half of the year. Results presented are for GMO hybrids only, and these results will not be included in the Region Summary.
