TEST COMMENTS:

Freezing temperatures during the last week of April preceded several showers that moved through during the first week of May. Once soil temperatures were trending upward, the plot was planted by May 10. The pre-plant moisture allowed for nice and uniform emergence but it didn't last long. The location did not get adequate rainfall this season and endured a D1-intensity drought. However, a few scattered showers kept the plants alive through a very hot and dry summer to produce yields that were near the historic 8-yr average we have recorded for this area. Generally, subsoils were tapped out of moisture by mid-August, and the drought in this area severely impacted corn yields. Stalk quality was still excellent at the time of harvest. Kernel depth was shallow and ears were shorter than average.
