

Impact of Corn Hybrids with Multiple Traits

PEST PROBLEMS IN CORN

Corn crops face several pest challenges from insects, weeds and even volunteer corn. There can be multiple ways to deal with these pressures, including incorporating integrated pest and/or weed management programs. However, attention also needs to be paid to the potential for weed and insect resistance. Left unchecked, insects like corn earworm and European corn borer can damage yields, with declines of up to 25% from corn borer presence.¹ Weeds like waterhemp and marehail can take 5–20% and 32% of corn yield, respectively.^{2,3} Highly competitive volunteer corn can reduce yields by 13% in corn fields while encouraging western corn rootworm and gray leaf spot disease in later crops.⁴

INTRODUCTION OF BIOTECHNOLOGY TRAITS

The 1996 release of herbicide-tolerant corn and hybrids with protection against European corn borer changed farming practices. Corn traits these days have built upon those foundations, allowing for the use of additional herbicides and protecting against more insects. Traits help protect yields against damage caused by pests – following their adoption corn yields have improved by about two bushels per acre annually, which is a bigger and more consistent improvement than what farmers had experienced previously.⁵

Although hybrids with multiple traits may be more expensive than conventional hybrids, they can provide overall savings in terms of management, labor and fuel costs – especially when fuel prices are high or in areas where finding on-farm

workers is a challenge. Yields also tend to be more consistent, especially when using corn hybrids with multiple stacked traits, according to data from the Wisconsin Corn Hybrid Performance Trials.⁵

ADDRESSING WEED RESISTANCE WITH MULTIPLE MODES OF ACTION

Since the release of glyphosate-tolerant corn and the reliance on just one weed control method for so many years, 48 weed species have developed resistance.⁶ Bringing new traits to market takes a long time, which heightens the importance of employing an integrated weed management program that uses multiple tools – including row spacing, mechanical practices and incorporating herbicides with multiple, different modes of action.⁷

Corn hybrids with tolerance to multiple herbicides allow for the use of more modes of action against weeds and extend the lifetime of these herbicides by delaying the development of resistance. For example, planting PowerCore® Enlist® corn provides tolerance to four herbicides, including 2,4-D choline, glyphosate, glufosinate and FOPs. Glufosinate and 2,4-D choline can help manage late-season broadleaf weeds and 2,4-D choline can be sprayed on PowerCore Enlist corn up to 30" without causing damage. Having access to multiple modes of action also helps farmers address glyphosate-resistant grasses – including volunteer corn. Planting PowerCore Enlist corn, which is tolerant to FOPs, provides a way to control resistant grasses and volunteer non-Enlist® corn in Enlist corn fields with options like Assure II herbicide.⁸

CONCLUSION

There is a selection of tools available to farmers seeking to control weeds and insects in corn fields. However, as weeds and insects develop resistance to chemical control products, making the best use of integrated programs helps protect yield potential and supports the use of current control methods into the future. Planting corn hybrids with tolerance to herbicides with multiple modes of action – like PowerCore Enlist corn – can be one way to help farmers manage weeds and pests.

[®] Trademarks of Corteva Agriscience and its affiliated companies. The transgenic soybean event in Enlist E3® soybeans is jointly developed and owned by Corteva Agriscience and M.S. Technologies L.L.C. Enlist Duo® and Enlist One® herbicides are not registered for sale or use in all states or counties. Contact your state pesticide regulatory agency to determine if a product is registered for sale or use in your area. Enlist Duo and Enlist One are the only 2,4-D products authorized for use with Enlist crops. Consult Enlist herbicide labels for weed species controlled. POWERCORE® multi-event technology developed by Corteva

Agriscience and Monsanto. POWERCORE® is a registered trademark of Monsanto Technology LLC. Always follow IRM, grain marketing and all other stewardship practices and pesticide label directions. *Bt* products may not yet be registered in all states. Check with your seed representative for the registration status in your state. Assure® II herbicide is currently the only FOP herbicide for in-crop use with Enlist® corn. Assure II herbicide (quizalofop) is a Group 1 herbicide for grass control. Product responses can vary by location, pest population, environmental conditions, and agricultural practices. Please contact your Corteva Agriscience sales professional for information and suggestions specific to your operation. Individual results may vary. Various factors, including pest pressure, reduced susceptibility, and insect resistance in some pest populations may affect efficacy of certain corn technology products in some regions. To help extend durability of these technologies, Corteva Agriscience recommends you implement integrated pest management (IPM) practices such as crop rotation, cultural and biological control tactics (including rotating sources of *Bt*-protected corn traits), pest scouting, and appropriate use of pest thresholds when employing management practices such as insecticide application. You must also plant the required refuge when using these technologies. Please contact your sales professional or consult with your local university extension for more information regarding insect resistance management guidelines, best management practices and to understand whether there has been a shift in susceptibility or insect resistance with certain pests documented in your area. Bexfend™ biological fungicide, Hearken™ biological insecticide, Sossdia Stress abiotic stress mitigator, Sossdia Stress Plus abiotic stress mitigator and Utrisha™ N nutrient efficiency optimizer are not for sale or use in all states. Contact your state pesticide regulatory agency to determine if a product is registered for sale or use in your state. Liberty®, LibertyLink® and the Water Droplet Design are trademarks of BASF.
